

TippingPoint Software Release Announcement

Trend Micro™ TippingPoint is pleased to announce the release of SMS v5.4.0 and TPS v5.4.0 software, which provides the following new features and enhancements.

Client SSL Inspection

The TippingPoint appliances now feature Client SSL Inspection often referred to as outbound SSL Inspection. This version of inspection will help provide insights into client browsing behavior, returning visibility once lost to encryption. While the name implies SSL protocol support, all versions of TLS are also supported, up to TLS 1.3, all while maintaining Perfect Forward Secrecy (PFS).

TLS 1.3 Support

As part of the continued investment into industry adopted ciphers and protocols, support for TLS 1.3 has been introduced for both Server and Client SSL Inspection (inbound and outbound SSL Inspection). This support will enable organizations to adopt the most secure encryption techniques while still maintaining visibility into encrypted traffic traversing the network.

Congestion Visibility

The TippingPoint products now provide granular reporting of congestion within the TPS, including traffic not inspected. This insight will provide administrators with a deeper understanding of where congestion is occurring within the network, and if within TippingPoint, information that can assist in its relief.

VMware vSphere 6.7 Support

The TippingPoint vSMS now supports deployments on VMware vSphere 6.7. This will ensure that organizations are able to migrate to the newest hypervisors without risk that the TippingPoint SMS will become unavailable.

Additional Notes

- SMS v5.4.0 and TPS v5.4.0 will be released into manufacturing after 90 days and will include new devices as well as any RMA replacements.
- Multiple bugs were addressed in this release, as documented in the Release Notes
- SMS v5.4.0 includes the roll-up of SMS 5.3.0 Patch 1 and Patch 2

For a complete list of enhancements and changes, refer to the product [Release Notes](#).
