

TippingPoint Product Announcement

NDR Visibility Support for the TXE Platform TippingPoint 8600TXE SMS/TPS v6.3.0

April 9, 2024

Trend Micro™ is pleased to announce TippingPoint software v6.3.0 for SMS and TPS and the introduction of the following new offerings:

❖ Add NDR visibility to your IPS deployment:

TXE customers can activate **Vision One NDR** visibility in addition to IPS enforcement capabilities. The TXE platform takes a unique approach - isolating and reserving platform resources for NDR visibility without compromising inline reliability in order to:

- **Discover your attack surface:** Find unknown assets with network telemetry and correlate with AD data, vulnerability scan, and endpoint context.
- **Identify risky activities:** Track suspicious behavior beyond IPS filters, such as large, unexpected file transfers and suspicious login attempts – Trend's AI/ML driven approach analyzes context from the network to integrations to endpoint.
- **Prioritize your riskiest assets:** Continuously assessed risk now includes suspicious network behaviors and known detections.
- **Act with prioritized recommendations:** Leverage the power of your inline IPS with Vision One workflows to remediate by blocking IP, FQDN and URLs or by deploying virtual patching recommendations customized to your environment.
- **Visualize incidents for faster, comprehensive remediation:** Network telemetry is archived and available to visualize incidents – showing network connected resources and network communications over time.

These benefits will be available for activation in Vision One starting early May as part of a complimentary public preview for all TXE customers.

❖ TippingPoint 8600TXE

Following on from the recent introduction of the TippingPoint 9200TXE, Trend Micro is pleased to announce the latest member to the family, the TippingPoint 8600TXE.

The TippingPoint 8600TXE supports inspection licenses from 5Gbps to 40Gbps, and can be stacked with other 8600TXE up to a maximum of 5 devices, delivering a combined throughput of 200Gbps.

In addition, the TippingPoint 8600TXE supports the same IO modules as the 9200TXE, offering 25GbE and 100GbE connectivity options in both bypass and non-bypass flavors. Trend Micro is also introducing a 6-segment 1GbE copper bypass module in addition to the other IO modules already available.

Refer to the product [Release Notes](#) for a complete list of enhancements and changes.
